

Ideation Phase

Empathize & Discover

Date	9 March 2026
Team ID	SWUID202641986
Project Name	Insurance Fraud Detection Using Machine Learning
Maximum Marks	4 Marks

1. Think & Feel

- **Efficiency:** "I need to process these 50 claims today. Which ones are actually suspicious?"
- **Accuracy:** "I don't want to decline a genuine claim and hurt a loyal customer, but I can't let fraud slip through."
- **Pressure:** "The company is losing millions to fraud. I feel the pressure to improve detection rates."
- **Skepticism:** "Is this 'minor' collision really as severe as they say? The repair costs seem inflated."
- **Justice:** "It's unfair that honest people pay higher premiums because of these scammers."

2. Hear

- **Management:** "We need to reduce the fraud loss ratio by 15% this quarter."
- **Colleagues:** "Wait until you see this claim from policyholder X; it follows the exact same pattern as the staging ring we caught last month."
- **Legal Team:** "Ensure we have solid evidence before marking this as 'Confirmed Fraud'."
- **Industry News:** "New technology is making it easier for fraudsters to fabricate injury claims."

3. See

- **Data Dashboards:** Complex screens filled with claim numbers, policy details, and historical data.
- **Photos:** Pictures of vehicles with varying degrees of damage, police reports, and medical bills.
- **Red Flags:** Discrepancies between the self-reported incident hour and the damage severity.
- **Pattern Matching:** Seeing similar incident types (e.g., rear-end collisions) occurring in the same geographic area.

4. Say & Do

- **Publicly:** "We investigate every claim thoroughly to ensure fair payouts."
- **To Policyholders:** Asking clarifying questions about witnesses and the exact sequence of events.
- **Behavior:** Cross-referencing claim details with the ML model's prediction percentage.
- **Collaborating:** Sharing insights with the Special Investigations Unit (SIU) about suspicious clusters.
